RELOCATION AND EXPANSION PROJECT, COOKERS BULK OIL SYSTEMS PLANT

CLIENT: COOKERS BULK OIL SYSTEMS
LOCATION: WA
YEAR: 2016

PROJECT SCOPE

TFG Group is pleased to have assisted Cookers Bulk Oil Systems in their commitment to innovation in providing their clients with fresh oil solutions and sustainable management of bulk oils. TFG collaborated with Cookers for a three month project to install and upgrade the capacity of the tanks for bulk oils handling in their Perth plant.

EXPERIENCE & EXPERTISE

Our specialised process pipe tradesman fitted and installed four new tanks to increase the capacity to six fresh oil tanks while also doubling the capacity of an existing waste oil tank. TFG installed the tanks and associated pipework to increase the filtration from a stage one filter to a three stage micro filtration process. In addition, at Cookers new facility the capacity increased from 90,000 litres to 300,000 litres. TFG were integral in doubling the waste oil capabilities from 30,000 litres to 60,000 litres.

INNOVATION

TFG designed, fabricated and installed two valve manifold systems, allowing efficient transfer of product between tanks to the trucks for the loading and unloading process. In addition to this specialised fabrication TFG sourced, fabricated and installed with precision the two swivel truck systems which increases operational efficiency in the transfer of oils.

Fabrication allowances were made for future expansion of two new fresh oil tanks through the manifold system at the facility.
